Let  $\Gamma$  be the circumcircle of acute-angled triangle  $ABC$ . Points  $D$  and  $E$  lie on segments  $AB$  and  $AC$ , respectively, such that  $AD = AE$ . The perpendicular bisectors of  $BD$  and  $CE$  intersect the minor arcs  $AB$  and  $AC$  of  $\Gamma$  at points  $F$  and  $G$ , respectively. Prove that the lines  $DE$  and  $FG$  are parallel (or are the same line).

---

Let the perpendicular bisector of  $BD$  hit  $\Gamma$  at  $F, F'$  and the perpendicular bisector of  $CE$  hit  $\Gamma$  at  $G, G'$ . Since  $B$  is the reflection of  $D$  over  $FF'$ ,  $D$  is the orthocenter of  $\triangle AFF'$ . Similarly,  $E$  is the orthocenter of  $\triangle AGG'$ , so if  $O$  is the center of  $\Gamma$ , then the distances from  $O$  to  $FF'$  and  $GG'$  are the same (equal to  $\frac{1}{2}AD = \frac{1}{2}AE$ ). It follows that  $FF' = GG'$ , so  $FG \parallel F'G'$ .

Work in the complex plane with  $\Gamma$  as the unit circle, setting  $a = x^2, b = y^2, c = z^2$  such that the midpoint of minor arc  $BC$  (call it  $M_A$ ) is at  $-yz$ . Then  $ff' + ab = 0$  and  $gg' + ac = 0$ , so  $fgf'g' = a^2bc = x^4y^2z^2$ . Since  $FG \parallel F'G'$ , we have that  $fg = f'g'$ , so  $fg = \pm x^2yz$ . The two cases correspond to  $FG \perp AM_A$  and  $FG \parallel AM_A$ . Since  $F$  and  $G$  are on minor arcs  $AB$  and  $AC$  while  $M_A$  is on minor arc  $BC$ ,  $FG \parallel AM_A$  is impossible, so  $FG \perp AM_A$ . Since  $AM_A \perp DE$ , we have that  $DE \parallel FG$ . ■
